```
Breast cancer differentially expressed gene product #47.
```

ds; cytostatic; gene therapy; DKFZp5661133 activity inhibitor; breast cancer; differential expression.

A method, useful for prognosing and treating solid tumor, comprises comparing an expression profile of a gene expressed in peripheral blood mononuclear cells to a reference expression profile of a gene. Disclosure, Page, 111pp, English Trepicchio WL, Strahs A, Trepicchio WI Immerman F, Dorner AJ; WPI; 2004-804779/79. (AMHP ) WYETH. (STRA/) STRAHS A. 

The invention relates to a method of inhibiting a cancerous phenotype of a cell comprises contacting a cancerous mammalian cell with an agent for inhibition of DKZP5661133 activity. The methods are useful for treating cancer, e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be used in the method of the invention. Inhibiting a cancerous phenotype of a cell, useful for treating breast cancer comprises contacting a cancerous mammalian cell with an agent for inhibition of DKFZp5661133 activity. Claim 30; SEQ ID NO 47; 257pp; English. WPI; 2003-577534/54. CHIR ) CHIRON CORP. Hansen

unaupervised clustering aecond classes is a subcluster formed by an unaupervised clustering about a second classes is a subcluster formed by an apoulation of patients who have the solid tumour, and where the majority of the first class of patients has a first clinical outcome, and the majority of the second class of patients as a second clinical outcome. Also described are: a system comprising (i) a memory or a storage medium including data that represent an expression profile of at the teat another storage medium including data that represent at least one reference expression profile of the gene. (iii) a program capable of comparing the expression profile to the reference expression profile, and (iv) a processor capable of executing the captesion profile, and (iv) a processor capable of executing the compourlear cells of patients who have the solid tumour correlate with clinical outcomes of the patients and a nucleic acid or protein array comprising concentrated probes for solid tumour prognosis genes, where cap patients of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients has a second class of the invention. Note: The sequence represents a solid tumour prognosis gene of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format

controlly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                        profile of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood mononuclear calls (PBMCs) of a first class of patients as compared to PBMCs of a second class of patients, where both the first and second classes of patients have the solid tumour, and each of the first and second classes is a subcluster formed by an
                                    invention describes a method comprising comparing an expression

                                                       The present sequence encodes the canine 5T4 tumour-associated antigen carcinomas but has a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the human or murine 5T4 gene sequence. The 5T4 antigen was shown to be the nucleic acid encoding the antigen and the antigen tresponse. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast

```
The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnostis or prognosis of breast cancer cells of or detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT0763 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lung cancer-associated polynucleotide; gene; ds; cytostatic; emphysema; antiinflammatory; antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the

transcript in a cell from a patient, comprising a range cancer transcript in a cell from a patient, comprising a contacting a blological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated polypeptide, for thibiting proliferation of a lung cancer-associated polypeptide, for thibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell corrections to other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful compounds that modulate lung cancer, such as antibodies. Sequences harviet and pulmo cancer, such as antibodies. Sequences harviet.
                                                                                                                                                  cancer-associated
patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                            The invention relates to a method for detecting a lung

The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polymucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The mucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, detecting and as vaccines. This sequence corresponds to one of the nucleic acids
                                                                                                                                                           Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used for the detection method of the invention.
                                                                                                                                                                                                                                                         Claim 10; Page 297; 332pp; English

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

No.:
The invention relates to mucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention; antibodies which specifically bind a
polypeptide of the invention; use of such antibodies for drug targeting;
and methods of screening for modulators of activity or expression of the
polypeptides and mucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosling and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, infilammatory diseases, autoimmune diseases, ratinal
neovascularistaion syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                              Gish KC, Glynne R, Hevezi PA;

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99127-ABV99595 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX poteins and coding sequences are useful in the manufacture of a andicament for treating sequences are useful in the manufacture of a andicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or disquences and proteins are useful for treating.

The NOVX coding sequences and proteins are useful for treating, concer, neurodegenerative diseases, ancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, fertility, bronchial asthma, AlDS, dyslipidemia, metabolic disorders, fertility, bronchial asthma, AlDS, dyslipidemia, metabolic disorders associated with obesity, metabolic syndrome X or wasting disorders associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or disanostic methods
                                                                    Rastelli L, Mezes PD, Smithson G, Guo X, Gerlach V, Casman SJ; Boldog FL, Li L, Zerhusen BD, Tchernev VT, Gangolli EA, Vernet CAM, Pena CEA, Burgess CE, Liu X, Spytek RA, Gorman L, Spaderna SK; Voss EZ, Malyankar UM, Anderson DW, Patturajan M, Miller CE; Taupier RJ, Padigaru M, Shenoy SG, Kekuda R, Gusev VY, Pochart PF;
                                                                                                                                                                                                                 New NOVX polypeptides and polymucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cDNA encoding feline oncofoetal leucine-rich glycoprotein, 5T4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Feline; cat; oncofoetal leucine-rich glycoprotein; 574; tumour; call proliferative disorder; infection; inflammatory condition; cancer immunotherapy; foetal cell; maternal blood; cytostatic; foetal abnormality; foetal sex determination; gene; ss.

The present invention relates to the isolation of canine and feline oncofectal leucine-rich glycoproteins known as 574, and the concofectal leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are treatment of tumours or other diseases associated with cell and/or treatment of tumours or other diseases associated with cell and/or proliferation, infections, and inflammatory conditions in animals, proliferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating focetal cells from maternal blood. The isolation process may form part of a diagnostic method e.g. the foctal cells may then be subject to biochemical or genetic sampling used for testing foctal abnormalities, or to determine the sex of the foctus (ss). The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                                                              Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length:

ò 셤 Major Histocompatibility Complex class I peptide epitope; MHC; Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other; 1260 9 0 0 (first entry) Feline 5T4 antigen DNA 04-DEC-2003 ADB97513;

```
The invention relates to a novel Major Histocompatibility Complex (MHC) class I peptide epitope of the 5T4 antigen. The invention further class I peptide epitope of the 5T4 antigen. The invention further provides a polyepitope string of the 5T4 epitope; a nucleic acid centuring the 5T4 epitope string of the 5T4 epitope; a vector system capable of acid to a cell, a cell pulsed with the 5T4 epitope, a polyepitope of the 5T4 epitope, a polyepitope of the 5T4 epitope, a polyepitope of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/its encoding nucleic acid in a subject; and a T cell line or clone capable of comprising the 5T4 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 5T4 epitope in conjunction with an MHC class in molecule. The 5T4 epitope or its encoding nucleic acid and the vector system or cell is useful in the prevention and/or treatment of a disease, particularly cancer. The detection method is useful for diagnosting or monitoring the 5T4 epitope or its ancel acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or is useful in the manufacture of a medicament for treating and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New major histocompatibility complex class I peptide epitopes from human
5T4 tumor-associated antigen, useful for preventing and/or treating a
disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preventing a disease. This polynucleotide sequence represents the feline
5T4 antigen, 5T4 epitope, polyepitope string, vaccine, T cell; cytostatic; cancer; feline; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a Major Histocompatibility Complex (WHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polymucleotide sequence represents the DNA coding for the feline 5T4 protein.
                                                                           gene; ds; feline; Major Histocompatibility Complex class II; MHC; epitope; 5T4 antigen; vaccine; T-cell; cytostatic; cancer; gene therapy.
                                                                                                                                                                                                                                                                                                                                                          New Major Histocompatibility Complex class II peptide epitope of 5T4, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

The present sequence encodes the human 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour fagnosis, targetling and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single chain antibody; ScFv; inflammatory disease; arthritis; cancer; hypersensitivity; autoimmune disease; central nervous system disorder; Parkinson's disease; periodontal disease; cardiopulmonary disease; cardiovascular disease; gastrointestinal disorder; infection; diabetes; Helicobacter-related disease; immune disorder; ss.

                                                                                                                                                                                                                                                                                                                                                                            which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The Scrw antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The Scrw antibody is also useful for treating inflammatory disease including arthritis, hypersensitivity, autoimmune diseases, cancers, central nervous system diseases, cancers, central nervous system diseases, cardiovascular diseases, periodontal diseases, cardiopulmonary diseases, cardiovascular diseases, gastrointestinal disorders, infections, diabetes, Helicobacterelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce Scrv of the invention
                                                                                                                                                                                                                                                                                                  Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.
                                                                                                                                                                                                                                Carroll MW, Ellard FM;
                                                                                                                                                                                                                                                                                                                                                                     The specification describes the use of a single chain antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Canine; dog; oncofoetal leucine-rich glycoprotein; 5T4; tumour;

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 514, and the concofoetal leucine-rich glycoproteins known as 514, and the proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell profit profit profit in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 514 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 514 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The called may then be subject to biochemical or genetic sampling used for cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel canine or feline 574 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes the mouse 5T4 tumour-associated antigen (TPA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour induced were inoculated with a virus expression vector containing the present sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor associated antigen, 5T4 capable of eliciting cytotoxic T\text{-lymphocyte} response useful in vaccinating against and in treating tumors.

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway—modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human cDNA differentially expressed in MYCN activated cells SeqID 105.
                                                                                                                                                                                                                                                                                                                            ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  **************
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠ
                                                                                                                                                                                                This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymocleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protoconcepuse that is amplified in neuroblastoms cells and is common in small cell lung cancers. The present invention describes these CDNA molecules as useful for in hybridisation assays to detect expression of mucleic acids (or complementary nucleic acids) in a present in a given sample, as useful for in hybridisations as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymocleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the US Patent Office at
                                                                                                                      New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; bladder cancer; cytostatic; gene therapy; vaccine; gene;

The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a blological sample from the patient with a polymucleotide to that selectively hybridises to a sequence that is 80 % identical to a concertance of sequences that is 80 % identical to a concertable of sequences (see ACC50951 to ACC50951 to ACC50951 to ACC51059 concertable of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059 concertable of sequences from the present invention have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in disgnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnosic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                  Detecting a bladder cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a bladder cancer-associated polynucleotide or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lung cancer-associated polynucleotide, gene, ds, cytostatic, emphysema, antinfiammatory, antiasthmatic, non-small cell lung cancer, atelectasis, small cell Lung cancer, benign lesion, precancerous lesion, bronchitis, chronic obstructive pulmonary disease, hypersensitivity pneumonitis, interstitial pulmonary fibrosis; fibrosis, asthma, bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2053 BP; 461 A; 602 C; 499 G; 491 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                       The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer compound that modulates a lung cancer-associated for identifying a compound that modulates a lung cancer-associated for identifying a compound that modulates a lung cancer-associated cell to treat lung cancer in a patient and for treating a memmal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell ung cancer or other benign or precancerous lestons, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences
                                                                                                                                                                                                Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; p53 pathway; Leucine rich repeat capricious related protein;

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity, where a difference between the agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA
                                                                                                                                                                                                                                                                                                       Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified leudine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA
                                                                                                Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, differential expression, cancer, angiogenic disorder,

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention or by detecting a polypeptide of the invention. The comprision of the invention, antibodies which specifically bind a nucleic acid of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and nucleic acids. The nucleic acids, polypeptides.

Contibodies and methods are useful for disgnosting, prognosting and treating cancer and other conditions such as psoriasis, is chaemad, heart disease, the convenient of the provenient of the content of the content of the content of the conditions and nucleic acids. According the content of the content of the conditions and nucleic acids and uterating including they may are according to the content of the conten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; tumour-associated antigenic target; TAT; cell death; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        also be useful in wound healing and in contraception. ```
The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of
                                                                                                                                                                                                                                 New PRO nucleic acid or polypeptide, useful for preparing a

Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for represents a human TAT cDNA sequence of the invention.

The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumour-associated antigenic target (TAT) cDNA DNA103471, SEQ 1D NO:2070.

CC The invention relates to human tumour-associated antigenic target (TAT) colypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide colypeptides, expression vectors and host cells comprising and TAT nucleic acids and colypeptides, expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptides, a peptide or organic cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antegonists, binding molecules and compositions are useful cantibodies, antegonists, binding molecules and compositions are useful increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, badder cancer, pancreatic cancer, cervical cancer, cancers of the central colorectal cancer, melanoma and leukaemia. TAT nucleic acids may further be cused as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; ss; multi-parameter high throughput screening; MPHTS; disease signature; neuropsychiatric; neurodegenerative; schizophrenia; bipolar affective disorder; BAD; autism; Parkinson's; Alzheimer's disease; neuroleptic; nootropic; antimanic; antidepressant.

This invention relates to a novel screening method identified as a multiparameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals differential expression between those cells taken from individuals affected by that disease and those that are not affected. The present invention then describes the screening of candidate pharmaceutical compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders including schizophrenia, bipolar affective disorder (BAD) and autism, as well as Parkinson's and Alzheimer's disease. Accordingly, the compounds of this invention exhibit various activities including neuroleptic, nootropic, antimanic and antidepressant. Furthermore, the screening method used in MPHTS will be automated, such that a large number of test compounds may be rapidly screened with a minimal amount of labour and effort. This polymucleotide is a human cDNA sequence of a gene that is differentially expressed in the presence of a peraperic compound and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene for bipolar affective disorder,
               Identifying a compound that can treat disease or disorders, such as, neuropsychiatric disorder e.g., schizophrenia, or autism, comprises determining the expression of one or more efficacy genes in a cell contacted with the test compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1; chromosome mapping; gene mapping; gene therapy; forensic; supplement; medical imaging; diagnostic; genetic disorder; ss.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed carriers. (I) is useful in gene therapy techniques to restore normal cartivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and cannot or produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this contract of the printed specification, but was obtained in
                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2338 BP; 519 A; 677 C; 608 G; 534 T; 0 U; 0 Other;

The invention relates to primers for synthesising full length CDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length cDnts were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this specent din not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                                                               830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                      Claim 8; SEQ ID NO 2864; 1380pp + Sequence Listing; English.

```
This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA from both the 5' and 3' full length human cDNA clone of the invention.

protein or its epitope-bearing fragments to a non-human animal as an antipody antipose. The protein or its epitope-bearing fragments to a non-human animal as an antipose. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STATE activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STATE activation such as allegic diseases, inflammation, autoimmune diseases, diabetes, also the for treating disease associated with STATE activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arthitis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid haemotrhage, viral hepatitis and AIDS. The protein has efficient promoting STATE activity. The protein or mucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive activation or inhibition of STATE. The present sequence represents a human cDNA encoding a protein which promotes STATE activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide primers (830 cDNAs) useful for synthesizing full length human cDNAs.

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.

cuseful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antibody. Which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or canceptability to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STATS activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful cor to the treating disease associated with STATS activation such as allergic diseases, inflammation, autoimmune disease, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STATS activation and/or prevention of Thi hyperactive diseases associated with STATS activation and/or prevention of Thi hyperactive diseases. Subarachonid hasmoring allergic rhintis, ischaemic heart diseases, subarachonid hasmorings, viral hepatitis and AIDS. The protein has efficient promoting STATS activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with axessaive compounds for treating and preventing disease associated with axessaive activation or inhibition of STATS. The present associated with axessaive activation or inhibition of STATS. The present management of activation or inhibition of STATS. The present managements are activated with axessaive managements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STATE; immunogen; STATE activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; autoimmune disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematosus; sepsis; asthma; allergic rhinitis; isolaemic heart disease; subaracchnoid haemorrhage; viral hepatitis; AIDS.

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein for its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression a activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharaccutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmune diseases, diabetes, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, inflammation, autoimmune diseases, diabetes, compositions disease associated with STAT6 activation and/or prevention of treating disease associated with STAT6 activation and/or prevention of thin hyperactive diseases. Compositions are also useful in rheumatoid arthitis, osteoarthitis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischaemic heart diseases, subarachnoid hemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 activation or inhibition of STAT6. The present sequence represents a human cDNA encoding a protein which promotes STAT6 activation.
                                                                                                                                                                                                                                                                                                                                                                           New signal transducer and activator of transcription 6 activation promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g.

New first nucleic acid molecule comprising a polynucleotide sequence given in the specification, useful in preparing a composition for diagnosing or treating e.g., cancer, psoriasis or ulcerative colitis.

Claim 1; SEQ ID NO 283; 291pp; English.

The invention describes a new first nucleic acid molecule comprising a polynucleotide sequence given in the specification. Also described are: an animal injected with the nucleic acid molecule; a second nucleic acid molecule about 70, 80, 90 or 95\* homologous to the first nucleic acid molecule or that hybridises to the first polynucleotide sequence that is at least a pringency conditions; a vector comprising the nucleic acid molecule or a promoter that drives the expression of the nucleic acid molecule and a promoter that drives the expression of the nucleic acid molecule and ucleic acid molecule; a nucleic acid molecule; a nucleic acid molecule; a nucleic acid molecule; a nucleic acid molecule and a carrier or a buffer and one or more compositions comprising the nucleic acid molecule and animal injected with the polypeptide; a polypeptide composition comprising the notypeptide; a nucleic acid molecule molecule and a carrier or buffer; a cell animal injected with the polypeptide and acarrier or buffer; a cell culture medium comprising the polypeptide or transfected cells transfected with the polypeptide or transfected cells transfected with the polypeptide; and acrivitor or infected host cell; synthesising Nanodiscs simultaneously and for synthesising a series of simultaneously-synthesised Nanodiscs and for synthesising a derivatal structure; immunising a non-human animal; cordetermination of crystal structure; immunising a non-human animal; screening for modulators of the processor of the polypeptide in a sample, an antibody specifically recognising, binding to or modulating a child complement; determining the presence of an antibody to the polypeptide in a sample. An antibody specifically recognising, binding to or modulating and molecule or the biological activity of at least one polypeptide. acid molecule or its biologically active fragment; an antibody composition comprising the antibody and a carrier; a bacteriophage, where the antibody is displayed on the bacteriophage; a bacterial cell comprising the bacteriophage; a non-human animal injected with the

antibody composition; a host cell that secretes the antibody; making an antibody; diagnosing a disease, disorder, syndrome, or condition comprising cancer, or proliferative, inflammatory, immune, metabolic, bone, CNS, genetic, bacterial and viral diseases, disorders, syndromes or conditions in a patient; a modulator composition comprising a modulator and a carrier; gene therapy; prophylactic or therapeutic treatment of a subject; an isolated modified cell comprising at least one first heterologous nucleic acid molecule, where the first heterologous nucleic that polypeptide; a non-human animal deficient in the polypeptide or first hon-human animal; and one or more cells derived from the non-human animal; and one or more cells derived from the non-human animal; and one or more cells derived from the non-human animal; and one or more cells derived from the non-human animal; and one or more cells derived from the non-human animal. diagnosing or treating e.g., cancer, psoriasis or ulcerative colitis. This sequence encodes a novel human polypeptide of the invention. \$

Claim 1; SEQ ID NO 30152; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of

The invention relates to sixty six novel isolated Drosophila melanogaster G-protein coupled receptors (GPCR). The GPCR proteins and nucleic acids are useful in the treatment and diagnosis of GPCR-related conditions. The GPCR proteins and nucleic acids are also useful for identifying modulators of GPCR proteins for use as insecticides. The nucleic acid can also be used to detect mutations in GPCR genes and gene expression products such as mRNA. AASS7072-AASS7203 represent D. melanogaster G-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sixty six Drosophila Melanogaster G-protein coupled receptors (GPCR), useful in the treatment and diagnosis of GPCR-related conditions and for identifying GPCR modulators for use as insecticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           coupled protein receptor genomic and coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila; G-protein coupled receptor; GCPR; insecticide; diagnostic; mutation detection; ds.
insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention describes an isolated protein (I) consisting or comprising an amino acid sequences (SI), as given in the specification, an allelic variant of (SI), an orthologue of (SI) or fragment of (SI). (I) allelic variant of (SI), an orthologue of (SI) or fragment of (SI). (I) is useful for identifying an agent that binds to (I) which comprises contacting the protein with an agent and assaying the contacted mixture to determine whether a complex is formed with the agent bound to the protein. (I) is useful for identifying modulators as potential or insecticides, to determine the biological activity of the protein of insecticides, to determine for high-throughput screening), as targets for insecticides, to determine for high-throughput screening), as targets contacting agents for use in human drugs and for identifying compounds that receptor activity. An antibody (II) that selectively binds to (I) is useful for assessing normal and aberrant subcellular compounds that modulate G-protein coupled receptor (GPCR) nucleic acid expression, diagnostic assays for qualitative changes in GPCR nucleic acid that lead to insecticidal activity/tolerance, to detect mutations in GPCR may and as an agent and activity and as an amand an amand and an expression of nucleic acid expression. A host cell comprising a vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated G-protein coupled receptor useful for identifying modulators as potential insecticides, to determine the biological activity of the protein and for identifying compounds that modulate receptor activity.
                                                                                                                                                                                                                                                                                                                                                                                                                    G-protein coupled receptor; GPCR; insecticide; drug screening; insecticide screening; insecticidal activity; insecticidal tolerance;
                                                                                                                                                                                                                                                                                                                                                                                 Drosophila G protein coupled receptor genomic DNA seq id 22.

New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.

Claim 1; SEQ ID NO 10736; 15pp; English

The invention describes a recombinant DNA construct comprising a polymuclectide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office a to fitp, sequence then 17boc1D:2004034888. The polymuclectide of the invention are also useful in physical arrays of molecules and as

om base 200001 (Human cancer-associated genomic DNA LOCUS ABD32791 Accession Abd32791
             improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lighin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polymucleotide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cancer-associated protein; CAP; cancer-associated gene; CA; gene;
breeding markers. The recombinant DNA construct is useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                           The invention relates to cancer-associated proteins (CAP) and the cancer-associated (CA) nucleic acids encoding them. The invention also relates to a method for treating cancers involving administering to a patient an inhibitor of CAP, and a method of screening for anticancer activity in a potential drug involving providing a cell that expresses a CA gene, contacting a tissue sample derived from a cancer cell with an anticancer drug candidate and monitoring the effect of the anticancer drug candidate on expression of the CA gene. The CAP proteins are useful for detecting cancer associated with expression of a CAP protein in a test cell sample and for screening for a bioactive agent capable of modulating the activity of a CAP protein. The CA nucleic acids are useful for diagnosing cancer, involving determining the expression of a CA nucleic acid in a tissue. This sequence represents a human CA gene of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                 Novel human cancer associated protein encoded within open reading frame of cancer associated gene, useful as targets for diagnosing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumor marker; 88; gene; lung tumor; cytostatic; neoplasm; expression;

```

```
The invention relates to providing a patient diagnosis for lung cancer comprising comparing the level of expression of genes or gene products in a biological sample from a normal level of expression of genes or gene products in a biological sample from a normal individual.

Also included are distinguishing between normal and disease tissues, conditionable of a patient being treated for lung cancer by administering an anti-cancer agent, identifying a compound useful for the treatment of lung cancer and an array for distinguishing between normal conditions and disease tissues (comprising 2 or more probes corresponding to 2 or more genes selected from any of the 200 nucleotide sequences given in the specification). In providing a patient diagnosis for lung cancer, one or more genes are selected from any of the 200 nucleotide sequences as mentioned in the specification, or one or more genes products are polypeptides selected from any of the 200 nucleotide sequences as mentioned in the specification, or one or more genes products are polypeptides selected from any of the 200 nucleotide sequences are polypeptides selected from any of the 200 nucleotide sequence are polypeptides selected from any of the 200 nucleotide sequence are polypeptides selected from any of the 200 nucleotide sequence act polypeptides selected from any of the 200 nucleotide sequence data for this patent did not form part of the present sequence represent a cDNA from one of the 200 und concer marker genes. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did nelectronic format directly from WIPO
                                                                                                                      Providing a patient diagnosis for lung cancer comprises comparing the level of expression of genes or gene products in a biological sample from the patient with that from a normal individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, calcium/calmodulin-dependent protein kinase-like gene; CADPKL; ds; gene; neuropsychiarric disorder; attention deficit disorder; ADD; schizoaffective disorder; inpolar disorder; unipolar affective disorder; schizophrenia; adolescent conduct disorder; pharmacogenomics; fingerprinting; paternity testing; antidepressant; neuroleptic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 114596 BP; 33213 A; 26849 C; 24628 G; 29906 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š
                                                                                                                                                                                                The invention relates to a nucleic acid comprising a polymorphic region of a Calcium/Calmodulin-dependent protein kinase-like gene (CADPKL) allelic variant, and the polypeptide it encodes. CADPKL allelic variants are useful in determining whether a subject has or is at risk of developing a neuropsychiatric disorder, such as schizophrenia, attention deficit disorder (ADD), schizoaffective disorder, bipolar disorder, unipolar affective disorder and adolescent conduct disorder. The polypeptides, polymucleotides, antibodies and modulators of the CADPKL allelic variants are useful for disquosing or treating these antibodies to a CADPKL polypeptides may be used to raise antibodies to a CADPKL polypeptide. The nucleic acids may be used as probes or primers, in pharmacogenomics for designing therapies for the disorders, and in fingerprinting for detection of different individuals
                                                                                                                 New variants of calcium/calmodulin-dependent protein kinase-like nucleic acids and polypeptides, useful for diagnosing and treating neuropsychiatric disorders, e.g. schizophrenia, schizoaffective disorder, and bipolar disorder.
                                                                                                                                                                                                                                                                                                                                                       with the same species (e.g. paternity testing). This sequence represents human CADPKL genomic DNA of the invention

The invention describes a method of monitoring differential expression of the genes in a first Bacillus cells relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells, examining the array, and determining array of Bacillus comprision by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells. The method is useful for monitoring control argumental argumental serveral genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and controling gene copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes in culture conditions, conversion of genes may be used to provide a representation of the way controling streams of pens may be used to provide a representation of the way controling streams or other physiological provocation. Extensive follow conformental stress or other physiological provocation. Extensive follow controling frame, since sequence information is available.

This sequence represents a genomic sequence tag (GST) used in the method of the invention. Note: The sequence tag (GST) used in the method cof the invention. Note: The sequence tag for this patent did not form to part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                             Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, cytosine methylation, 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide for detecting cytosine methylation SEQ ID NO 20421.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1209 BP; 376 A; 289 C; 295 G; 249 T; 0 U; 0 Other;

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated c, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomaclectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of clipomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the central nervolus, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation investigating cell differentiation. The method allows the methylation are spirally represent genomic DNA sequences used to illustrate the method in the for the contained the contained of the contained of a wide respiratory squences used to illustrate the method in the contained the contained the contained of the contained the contained of the contained the contained of the co
                                                                                                                                                                                                                                                                                                                                Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1859 BP; 717 A; 648 C; 251 G; 243 T; 0 U; 0 Other;

Sanger Xenopus tropicalis EST/CDNA project.
This sequence is from a Xenopus Gene Collection (XGC) library, from
a library constructed by Aaron M. Zorn. CDNA was prepared from RNA
extracted from gastrula embryos. EcoRI-NotI cut CDNA was then
ligated into pCS107 with EcoRI at the 5' end and NotI at the 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rattus norvegicus 5T4 oncofetal antigen homolog (5T4) mRNA, complete cds.
